

ECEA 5348- Project 1

Implementation/Assumption Notes

Objective- Create an Amazon Web Services connection that will:

1. Send data to an AWS IoT Thing that will display temperature, humidity, and timestamps read in from a pseudo sensor.
2. Display communications status (steps of connection, messages sent) on the command line, and capture a successful connection session.
3. Contain a rule to the AWS IoT Thing to send incoming data to an SQS Queue.
4. Have viewable data in the AWS SQS Queue in the AWS console to see messages arriving from the connected Python data server.
5. Use the Boto3 SQS library to act as a client that removes messages from the SQS queue and displays them on the command line.
6. Data from the pseudo sensor is humidity between 0 and 100%, and temperature between -20 and 100 degrees Fahrenheit.

Additional Notes

1. IDE is set up with: AWS Cloud9, Win10, Python, MQTT.
2. PDF submission will include:
 - a. The data server tracing it's connection to AWS
 - b. The data server sending messages (JSON timestamps, temperature, and humidity values) to AWS
 - c. The client connecting to AWS SQS
 - d. The client showing the timestamps of incoming SQS messages
 - e. Captures of failed communication for the server or client.

Capture 1- Data server tracing connection to AWS:

```
27= for i in range(10):
28
29     h,t = ps.generate_values()
30     foo={"H":[h],"T":[t],"Time":[timein]}
31     # print("i ",i)
32
33     json_dump=json.dumps(foo)
34     msg = json_dump
35     topic = "general/inbound"
36     myMQTTClient.publish(topic, msg, 0)
37     print("Message Sent")
38     #Rule to send messages to SQS
39     response=queue.send_message(MessageBody=msg)
40
41 myMQTTClient.disconnect()
42 print("Client Disconnected")
```

bash - "ip-172-31-14-132" x
